Today's lecture

- Another way to get non-linear models in a linear form—adaptive basis function models.
- A general algorithm for greedy function approximation—gradient boosting machine.

Motivation

Recap: Adaboost

FINAL CLASSIFIER $G(x) = \mathrm{sign}\left[\sum_{m=1}^{M}lpha_m G_m(x) ight]$ Weighted Sample \cdots $G_M(x)$ Weighted Sample $G_3(x)$ Weighted Sample $G_2(x)$ Training Sample $G_1(x)$

4 / 25

AdaBoost: Algorithm

Given training set $\mathcal{D} = \{(x_1, y_1), \dots, (x_n, y_n)\}.$

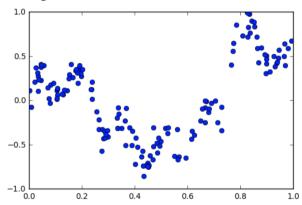

- 1 Initialize observation weights $w_i = 1, i = 1, 2, ..., n$.
- ② For m = 1 to M:
 - Base learner fits weighted training data and returns $G_m(x)$
 - ② Compute weighted empirical 0-1 risk:

$$\operatorname{err}_m = \frac{1}{W} \sum_{i=1}^n w_i \mathbb{1}(y_i \neq G_m(x_i))$$
 where $W = \sum_{i=1}^n w_i$.

- Compute classifier weight: $\alpha_m = \ln\left(\frac{1 \text{err}_m}{\text{err}_m}\right)$.
- **1** Update example weight: $w_i \leftarrow w_i \cdot \exp[\alpha_m 1(y_i \neq G_m(x_i))]$
- **3** Return voted classifier: $G(x) = \text{sign}\left[\sum_{m=1}^{M} \alpha_m G_m(x)\right]$. Why not learn G(x) directly?

Nonlinear Regression

• How do we fit the following data?

He He (CDS, NYU) DS-GA 1003 April 13, 2021

6 / 25

Linear Model with Basis Functions

• Fit a linear combination of transformations of the input:

$$f(x) = \sum_{m=1}^{M} v_m h_m(x),$$

where h_m 's are called **basis functions** (or feature functions in ML):

$$h_1,\ldots,h_M:\mathcal{X}\to\mathsf{R}$$

- Example: polynomial regression where $h_m(x) = x^m$.
- Can we use this model for classification?
- Can fit this using standard methods for linear models (e.g. least squares, lasso, ridge, etc.)
 - Note that h_m 's are fixed and known, i.e. chosen ahead of time.

He He (CDS, NYU) DS-GA 1003 April 13, 2021 7 / 25

Adaptive Basis Function Model

- What if we want to learn the basis functions? (hence adaptive)
- Base hypothesis space \mathcal{H} consisting of functions $h: \mathcal{X} \to \mathbb{R}$.
- An adaptive basis function expansion over \mathcal{H} is an ensemble model:

$$f(x) = \sum_{m=1}^{M} v_m h_m(x), \tag{1}$$

8 / 25

where $v_m \in \mathbb{R}$ and $h_m \in \mathcal{H}$.

Combined hypothesis space:

$$\mathcal{F}_{M} = \left\{ \sum_{m=1}^{M} v_{m} h_{m}(x) \mid v_{m} \in \mathbb{R}, h_{m} \in \mathcal{H}, m = 1, \dots, M \right\}$$

• What are the learnable?

Empirical Risk Minimization

• What's our learning objective?

$$\hat{f} = \underset{f \in \mathcal{F}_M}{\operatorname{arg \, min}} \frac{1}{n} \sum_{i=1}^{n} \ell(y_i, f(x_i)),$$

for some loss function ℓ .

• Write ERM objective function as

$$J(v_1,...,v_M,h_1,...,h_M) = \frac{1}{n} \sum_{i=1}^n \ell\left(y_i, \sum_{m=1}^M v_m h_m(x)\right).$$

• How to optimize *J*? i.e. how to learn?

He He (CDS, NYU) DS-GA 1003 April 13, 2021 9 / 25

Gradient-Based Methods

• Suppose our base hypothesis space is parameterized by $\Theta = \mathbb{R}^b$:

$$J(v_1,\ldots,v_M,\theta_1,\ldots,\theta_M) = \frac{1}{n}\sum_{i=1}^n \ell\left(y_i,\sum_{m=1}^M v_m h(x;\theta_m)\right).$$

- Can we optimize it with SGD?
 - Can we differentiate J w.r.t. v_m 's and θ_m 's?
- For some hypothesis spaces and typical loss functions, yes!
 - Neural networks fall into this category! (h_1, \ldots, h_M) are neurons of last hidden layer.)

He He (CDS, NYU) DS-GA 1003 April 13, 2021 10 / 25

What if Gradient Based Methods Don't Apply?

What if base hypothesis space ${\mathcal H}$ consists of decision trees?

- Can we even parameterize trees with $\Theta = \mathbb{R}^b$?
- Even if we could, predictions would not change continuously w.r.t. $\theta \in \Theta$, so certainly not differentiable.

What about a greedy algorithm similar to Adaboost?

- Applies to non-parametric or non-differentiable basis functions.
- But is it optimizing our objective using some loss function?

Today we'll discuss gradient boosting.

- Gradient descent in the function space.
- It applies whenever
 - our loss function is [sub]differentiable w.r.t. training predictions $f(x_i)$, and

History

Kearns, Valiant (1989): Can weak learners (e.g., 51% accuracy) be transformed to strong learners (e.g., 99.9% accuracy)?

Schapire (1990) & Freund (1995): Yes, weak learners can be iteratively improved to a strong learner.

Freund, Schapire (1996): And here is a practical algorithm—Adaboost.

Breiman (1996 & 1998): Yes, it works! Boosting is the best off-the-shelf classifier in the world.

(Attempts to explain why Adaboost works and improvements)

Friedman, Hastie, Tibshirani (2000): Actually, boosting fits an additive model.

Friedman (2001): Furthermore, it can be considered as gradient de-

scent in the function space.

Forward Stagewise Additive Modeling

Forward Stagewise Additive Modeling (FSAM)

Goal fit model $f(x) = \sum_{m=1}^{M} v_m h_m(x)$ given some loss function.

Approach Greedily fit one function at a time without adjusting previous functions, hence "forward stagewise".

• After m-1 stages, we have

$$f_{m-1} = \sum_{i=1}^{m-1} v_i h_i.$$

• In m'th round, we want to find $h_m \in \mathcal{H}$ (i.e. a basis function) and $v_m > 0$ such that

$$f_m = \underbrace{f_{m-1}}_{\text{fixed}} + v_m h_m$$

improves objective function value by as much as possible.

Forward Stagewise Additive Modeling for ERM

Let's plug in our objective function.

- Initialize $f_0(x) = 0$.
- 2 For m=1 to M:
 - Compute:

$$(v_m, h_m) = \underset{v \in \mathbb{R}, h \in \mathcal{H}}{\operatorname{arg\,min}} \frac{1}{n} \sum_{i=1}^n \ell \left(y_i, f_{m-1}(x_i) \underbrace{+vh(x_i)}_{\text{new piece}} \right).$$

- **2** Set $f_m = f_{m-1} + v_m h_m$.
- \odot Return: f_M .

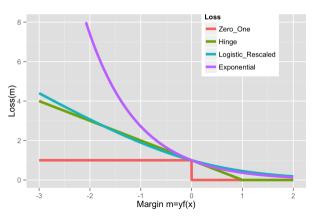

Recap: margin-based classifier

Binary classification

- Outcome space $\mathcal{Y} = \{-1, 1\}$
- Action space A = R (model outoput)
- Score function $f: \mathcal{X} \to \mathcal{A}$.
- Margin for example (x, y) is m = yf(x).
 - $m > 0 \iff$ classification correct
 - Larger *m* is better.
- Concept check: What are margin-based loss functions we've seen?

Exponential Loss

• Introduce the **exponential loss**: $\ell(y, f(x)) = \exp\left(-\underbrace{yf(x)}_{\text{margin}}\right)$.

He He (CDS, NYU) DS-GA 1003 April 13, 2021 17/25

Forward Stagewise Additive Modeling with exponential loss

Recall that we want to do FSAM with exponential loss.

- Initialize $f_0(x) = 0$.
- 2 For m = 1 to M:
 - Compute:

$$(v_m, h_m) = \underset{v \in \mathbb{R}, h \in \mathcal{H}}{\arg\min} \frac{1}{n} \sum_{i=1}^n \ell_{\exp} \left(y_i, f_{m-1}(x_i) \underbrace{+vh(x_i)}_{\text{new piece}} \right).$$

- **9** Set $f_m = f_{m-1} + v_m h_m$.
- \odot Return: f_M .

FSAM with Exponential Loss: objective function

- Base hypothesis: $\mathcal{H} = \{h: \mathcal{X} \to \{-1, 1\}\}.$
- Objective function in the *m*'th round:

$$J(v,h) = \sum_{i=1}^{n} \exp\left[-y_i \left(f_{m-1}(x_i) + vh(x_i)\right)\right]$$
 (2)

$$= \sum_{i=1}^{n} w_i^m \exp[-y_i v h(x_i)] \qquad \qquad w_i^m \stackrel{\text{def}}{=} \exp[-y_i f_{m-1}(x_i)] \qquad (3)$$

$$= \sum_{i=1}^{n} w_{i}^{m} \left[\mathbb{I} \left(y_{i} = h(x_{i}) \right) e^{-v} + \mathbb{I} \left(y_{i} \neq h(x_{i}) \right) e^{v} \right] \quad h(x_{i}) \in \{1, -1\}$$
(4)

$$= \sum_{i=1}^{n} w_{i}^{m} \left[(e^{v} - e^{-v}) \mathbb{I}(y_{i} \neq h(x_{i})) + e^{-v} \right] \qquad \qquad \mathbb{I}(y_{i} = h(x_{i})) = 1 - \mathbb{I}(y_{i} \neq h(x_{i}))$$

(5)

FSAM with Exponential Loss: basis function

• Objective function in the *m*'th round:

$$J(v,h) = \sum_{i=1}^{n} w_i^m \left[(e^v - e^{-v}) \mathbb{I}(y_i \neq h(x_i)) + e^{-v} \right].$$
 (6)

• If v > 0, then

$$\underset{h \in \mathcal{H}}{\arg\min} J(v, h) = \underset{h \in \mathcal{H}}{\arg\min} \sum_{i=1}^{n} w_i^m \mathbb{I}(y_i \neq h(x_i))$$
(7)

$$h_m = \arg\min_{h \in \mathcal{H}} \sum_{i=1}^n w_i^m \mathbb{I}(y_i \neq h(x_i))$$
(8)

$$= \arg\min_{h \in \mathcal{H}} \frac{1}{\sum_{i=1}^{n} w_i^m} \sum_{i=1}^{n} w_i^m \mathbb{I}(y_i \neq h(x_i)) \quad \text{multiply by a positive constant}$$

(9)

i.e. h_m is the minimizer of the weighted zero-one loss.

He He (CDS, NYU) DS-GA 1003 April 13, 2021 20 / 25

FSAM with Exponential Loss: classifier weights

• Define the weighted zero-one error:

$$err_{m} = \frac{\sum_{i=1}^{n} w_{i}^{m} \mathbb{I}(y_{i} \neq h(x_{i}))}{\sum_{i=1}^{n} w_{i}^{m}}.$$
 (10)

• Exercise: show that the optimal v is:

$$v_m = \frac{1}{2} \log \frac{1 - \operatorname{err}_m}{\operatorname{err}_m} \tag{11}$$

- Same as the classifier weights in Adaboost (differ by a constant).
- If $err_m < 0.5$ (better than chance), then $v_m > 0$.

He He (CDS, NYU) DS-GA 1003 April 13, 2021 21 / 25

FSAM with Exponential Loss: example weights

• Weights in the next round:

$$w_i^{m+1} \stackrel{\text{def}}{=} \exp\left[-y_i f_m(x_i)\right]$$

$$= w_i^m \exp\left[-y_i v_m h_m(x_i)\right]$$

$$f_m(x_i) = f_{m-1}(x_i) + v_m h_m(x_i)$$
(13)

$$= w_i^m \exp\left[-v_m \mathbb{I}(y_i = h_m(x_i)) + v_m \mathbb{I}(y_i \neq h_m(x_i))\right]$$
 (14)

$$= w_i^m \exp\left[2v_m \mathbb{I}\left(y_i \neq h_m(x_i)\right)\right] \underbrace{\exp^{-v_m}}_{\text{scaler}}$$
(15)

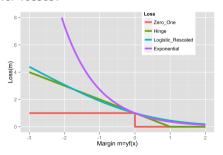

- The constant scaler will cancel out during normalization.
- $2v_m = \alpha_m$ in Adaboost.

Why Exponential Loss

- $\ell_{\exp}(y, f(x)) = \exp(-yf(x))$.
- Exercise: show that the optimal estimate is

$$f^*(x) = \frac{1}{2} \log \frac{p(y=1 \mid x)}{p(y=0 \mid x)}.$$
 (16)

• How is it different from other losses?

He He (CDS, NYU) DS-GA 1003 April 13, 2021 23 / 25

AdaBoost / Exponential Loss: Robustness Issues

- Exponential loss puts a high penalty on misclassified examples.
 - \implies not robust to outliers / noise.
- Empirically, AdaBoost has degraded performance in situations with
 - high Bayes error rate (intrinsic randomness in the label)
- Logistic/Log loss performs better in settings with high Bayes error.
- Exponential loss has some computational advantages over log loss though.

He He (CDS, NYU) DS-GA 1003 April 13, 2021 24/25

We've seen

- Use basis function to obtain nonlinear models: $f(x) = \sum_{i=1}^{M} v_m h_m(x)$ with known h_m 's.
- Adaptive basis function models: $f(x) = \sum_{i=1}^{M} v_m h_m(x)$ with unknown h_m 's.
- Forward stagewise additive modeling: greedily fit h_m 's to minimize the average loss.

But,

- We only know how to do FSAM for certain loss functions.
- Need to derive new algorithms for different loss functions.

Next, how to do FSAM in general.
